

Etanercept – Fact Sheet

Molecule

Etanercept (Enbrel®) is a dimeric human receptor fusion protein consisting of the extracellular ligand-binding domain of human 75kD (p75) tumor necrosis factor receptor (TNFR) linked to the Fc-part of human IgG1. The Fc-part of etanercept contains CH2 domain, CH3 domain and the hinge region. The molecular weight is approximately 150kD.

Mode of Action

TNF is a cytokine primarily produced by activated macrophages and T cells. One of the naturally occurring receptors is a 75kD (p75) TNFR. Monomers of the extracellular portion of TNFR are physiologically cleaved from cell surface (soluble TNFR, sTNFR) and bind with high affinity to circulating TNF- α . As such, they act as competitive inhibitors to TNF- α preventing it from binding to cell-bound TNFRs. Thus, the fusion protein etanercept competitively inhibits binding of TNF- α to TNFRs, rendering TNF- α biologically inactive. Etanercept also modulates indirectly different biological functions such as expression of adhesion molecule E-selectin, production of interleukin-6 (IL-6) and matrix metalloproteinase 3 (MMP-3), as well as IL-1.

Indication

Etanercept is applied for treatment of Rheumatoid Arthritis, Polyarticular Juvenile Idiopathic Arthritis, Psoriatic Arthritis, Ankylosing Spondylitis and Plaque Psoriasis.

Patent Situation

Enbrel® patents expired in 2012 in US and in 2015 in Europe. However, Amgen, the owner of originator Enbrel® fights to hold off biosimilars from the market until 2029 with new preparation patents.

Market and Competitive Field

Amgen's Enbrel® (co-marketed by Pfizer) has received its first approval by FDA in 1998 and by EMA in 2000. In 2017, Enbrel® had sales of 4.6 billion € (Amgen) and 535 million € (Pfizer). In respect of these blockbuster sales many companies are developing or marketing biosimilars of the drug, e.g. Sandoz and Merck. Benepali® is already approved by EMA and Erelzi™ by EMA and FDA.
